## 1. INDICATOR SETTINGS AND CONFIGURATION

To configure indicator settings for communication via Profibus protocol go to **<SETUP / Peripherals / Anybus module>** submenu. For detailed configuration read „**PUE HX7 Indicator**” user manual.

## 2. DATA STRUCTURE

### 2.1. Input Address

#### Input variables:

| Variable                     | Offset | Length [WORD] | Data type |
|------------------------------|--------|---------------|-----------|
| Platform 1 mass              | 0      | 2             | float     |
| Platform 1 tare              | 4      | 2             | float     |
| Platform 1 unit              | 8      | 1             | word      |
| Platform 1 status            | 10     | 1             | word      |
| Platform 1 LO threshold      | 12     | 2             | float     |
| Platform 2 mass              | 16     | 2             | float     |
| Platform 2 tare              | 20     | 2             | float     |
| Platform 2 unit              | 24     | 1             | word      |
| Platform 2 status            | 26     | 1             | word      |
| Platform 2 LO threshold      | 28     | 2             | float     |
| Process status (Stop, Start) | 64     | 1             | word      |
| Inputs status                | 66     | 1             | word      |
| Min                          | 68     | 2             | float     |
| Max                          | 72     | 2             | float     |
| Series number                | 84     | 2             | dword     |
| Operator                     | 88     | 1             | word      |
| Product                      | 90     | 1             | word      |
| Customer                     | 92     | 1             | word      |
| Packaging                    | 94     | 1             | word      |
| Formulation                  | 100    | 1             | word      |
| Dosing process               | 102    | 1             | word      |

## 2.2. Input Registers

**Platform mass** – returns platform mass in a current unit.

**Platform tare** – returns platform tare in an adjustment unit.

**Platform unit** – determines a current mass unit of a given platform.

| Unit bits |               |
|-----------|---------------|
| 0         | gram [g]      |
| 1         | kilogram [kg] |
| 2         | carat [ct]    |
| 3         | pound [lb]    |
| 4         | ounce [oz]    |
| 5         | Newton [N]    |

### Example:

Read HEX value: 0x02. Binary form:

| B1/7 | B1/6 | B1/5 | B1/4 | B1/3 | B1/2 | B1/1 | B1/0 | B0/7 | B0/6 | B0/5 | B0/4 | B0/3 | B0/2 | B0/1 | B0/0 |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 1    | 0    |

The unit of the weighing instrument is kilogram [kg].

**Platform status** – determines state of a given weighing platform.

| Status bits |   |
|-------------|---|
| 0           | Measurement correct (the weighing instrument does not report any error) |
| 1           | Measurement stable  |
| 2           | Weighing instrument indicates zero                                      |
| 3           | Weighing instrument tared   |
| 4           | Weighing instrument in II weighing range                                |
| 5           | Weighing instrument in III weighing range                               |
| 6           | Weighing instrument reports NULL error                                  |
| 7           | Weighing instrument reports LH error                                    |
| 8           | Weighing instrument reports FULL error                                  |

## **Example:**

Read HEX value: 0x13

| B1/7 | B1/6 | B1/5 | B1/4 | B1/3 | B1/2 | B1/1 | B1/0 | B0/7 | B0/6 | B0/5 | B0/4 | B0/3 | B0/2 | B0/1 | B0/0 |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 1    | 0    | 0    | 1    | 1    |

The weighing instrument does not report any error, measurement stable in II weighing range.

**LO threshold** – returns value of platform's LO threshold in an adjustment unit.

**Process status** – determines status of the dosing\formulation:

0x00 – process disabled

0x01 – process activated

0x02 – process aborted

0x03 – process completed

**Input state** – bitmask of indicator inputs. 4 first least significant bits represent weighing indicator inputs.

## **Example:**

Read HEX value: 0x000B

| B1/7 | B1/6 | B1/5 | B1/4 | B1/3 | B1/2 | B1/1 | B1/0 | B0/7 | B0/6 | B0/5 | B0/4 | B0/3 | B0/2 | B0/1 | B0/0 |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 1    | 0    | 1    | 1    |

Inputs number 1, 2 and 3 take HI state.

**MIN** – returns MIN threshold value (in a current unit).

**MAX** - returns MAX threshold value (in a current unit).

**Serial number** – returns serial number value. Numerical values exclusively! Any non-numerical values are neglected.

**Operator** – returns the value of a logged-in operator code.

**Product** – returns the value of a selected product code.

**Customer** – returns the value of a selected customer code.

**Packaging** – returns the value of a selected packaging code.

**Formulation** – returns the value of a selected formulation code.

**Dosing process** – returns the value of a selected dosing process code.

## 2.3. Output Address

### Output variables:

| Variable               | Offset | Length [WORD] | Data type |
|------------------------|--------|---------------|-----------|
| Command                | 0      | 1             | word      |
| Command with parameter | 2      | 1             | word      |
| Platform               | 4      | 1             | word      |
| Tare                   | 6      | 2             | float     |
| LO threshold           | 10     | 2             | float     |
| Output state           | 14     | 1             | word      |
| Min                    | 16     | 2             | float     |
| Max                    | 20     | 2             | float     |
| Serial number          | 32     | 2             | dword     |
| Operator               | 36     | 1             | word      |
| Product                | 38     | 1             | word      |
| Customer               | 40     | 1             | word      |
| Packaging              | 42     | 1             | word      |
| Formulation            | 48     | 1             | word      |
| Dosing process         | 50     | 1             | word      |

## 2.4. Output Registers

**Basic command** – record of the register via a given value triggers a respective operation:

| Bit No. | Operation         |
|---------|-------------------|
| 0       | Zero the platform |
| 1       | Tare the platform |
| 2       | Clear statistics  |
| 3       | Save/Print        |
| 4       | Process start     |
| 5       | Process stop      |

### Example:

Record of the register by value 0x02

| B1/7 | B1/6 | B1/5 | B1/4 | B1/3 | B1/2 | B1/1 | B1/0 | B0/7 | B0/6 | B0/5 | B0/4 | B0/3 | B0/2 | B0/1 | B0/0 |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 1    | 0    |

Scale taring is triggered.

|   |   |
|---|---|
|  | <b><i>A command is executed once upon detecting that its bit has been set. If the command is to be executed more than once, it is necessary to zero the bit first, and reset it to the required value next.</i></b> |
|---|---|

**Complex command** – setting a respective value triggers performance of a given task, see the table:

| Bit No. | Operation                                       |
|---------|---|
| 0       | Setting tare value for a given platform         |
| 1       | Setting LO threshold value for a given platform |
| 2       | Setting series number                           |
| 3       | Setting output status                           |
| 4       | Operator selection                              |
| 5       | Product selection                               |
| 6       | Packaging selection                             |
| 7       | Setting MIN threshold value                     |
| 8       | Customer selection                              |
| 9       | Source warehouse selection                      |
| 10      | Target warehouse selection                      |
| 11      | Dosing process selection                        |
| 12      | Setting MAX threshold value                     |

|   |  |
|---|--|
|  | <b><i>Complex command requires setting a respective parameter (offset from 4 to 50 – refer to output registers table)</i></b>  |
|  | <b><i>A command with a parameter is executed once when its bit setting is detected. If the command is to be executed more than once, it is necessary to zero the bit first, and reset it to the required value next.</i></b> |

### **Example:**

Sending tare of 1.0 value for platform 1 to the scale.

Performance of the command requires record of 3 registers:

offset 2 – command with parameter - value 0x01 – i.e. tare setting,

offset 4 – number of a platform to which tare is to be assigned - value 0x01 for platform 1,

offset 6 – tare value in float format - 1.0 .

**Platform** – complex command parameter: platform number (1 or 2).

**Tare** – complex command parameter: tare value (in an adjustment unit).

**LO threshold** – complex command parameter: LO threshold value (in an adjustment unit).

**Output state** – complex command parameter: status of weighing indicator and communication module outputs.

### **Example:**

Setting high state for output 1 and 3 of the indicator.

Output mask:

| B1/7 | B1/6 | B1/5 | B1/4 | B1/3 | B1/2 | B1/1 | B1/0 | B0/7 | B0/6 | B0/5 | B0/4 | B0/3 | B0/2 | B0/1 | B0/0 |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 1    | 0    | 1    |

Upon conversion to HEX the result is 0x05

Performance of the command requires record of 2 registers:

offset 2 – command with parameter - value 0x08 – i.e. output state record,

offset 14 – output mask 0x05.

This results with HI state of outputs number 1 and 3.

**MIN** – complex command parameter: MIN threshold value (in the unit set for the active working mode).

**MAX** – complex command parameter: MAX threshold value (in the unit set for the active working mode).

**Serial number** – complex command parameter: serial number value. Numerical values exclusively! Any non-numerical values are neglected

**Operator** – complex command parameter: operator code (digits only).

**Product** – complex command parameter: product code (digits only).

**Customer** – complex command parameter: customer code (digits only).

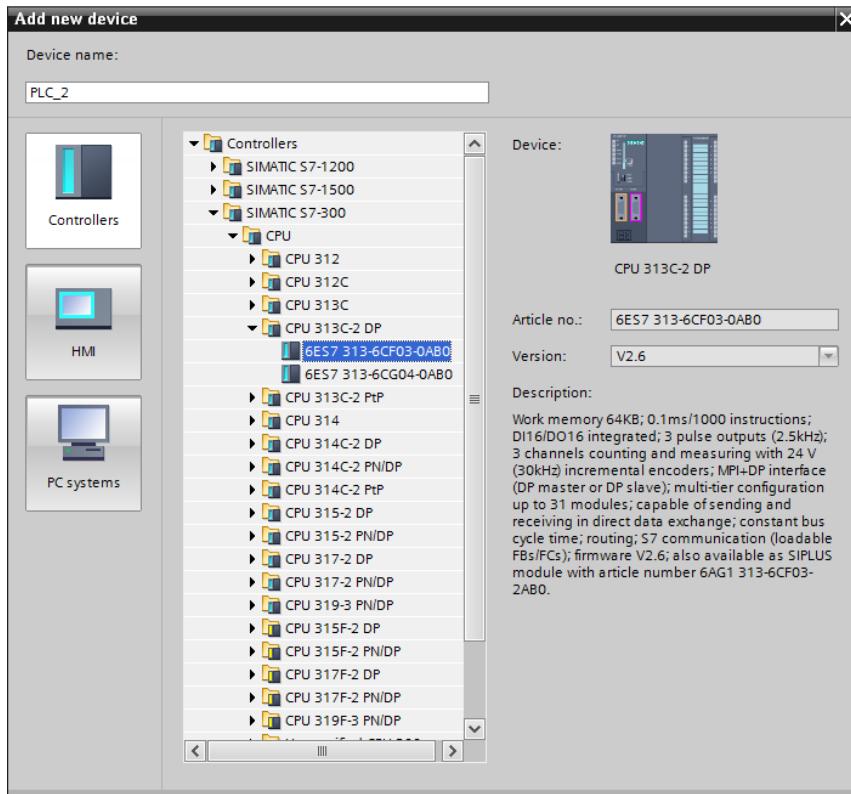

**Packaging** – complex command parameter: packaging code (digits only)

**Formulation** – complex command parameter: formulation code (digits only).

**Dosing process** – complex command parameter: dosing process code (digits only).

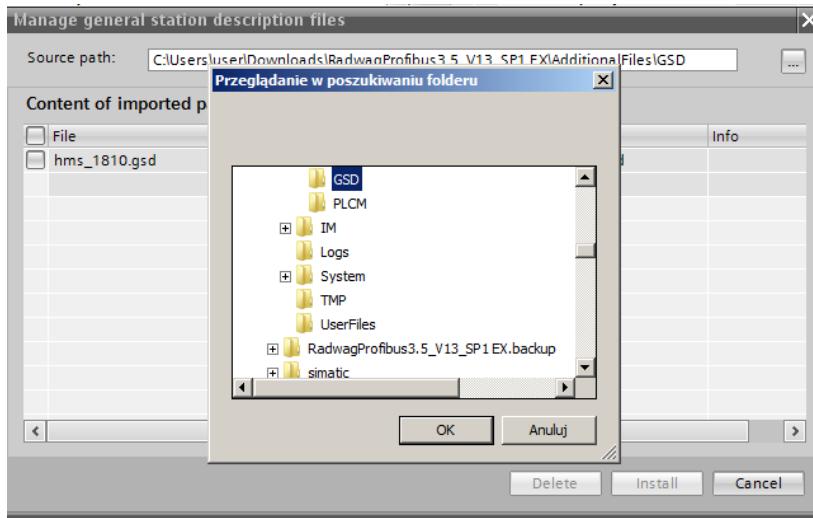

### 3. CONFIGURATION OF PROFIBUS MODULE IN TIA PORTAL V13 ENVIRONMENT

Start operation in the environment by setting up a new project, where topology of PROFIBUS network with MASTER controller will be specified, in this case the MASTER controller is SIEMENS controller of S7-300 series.

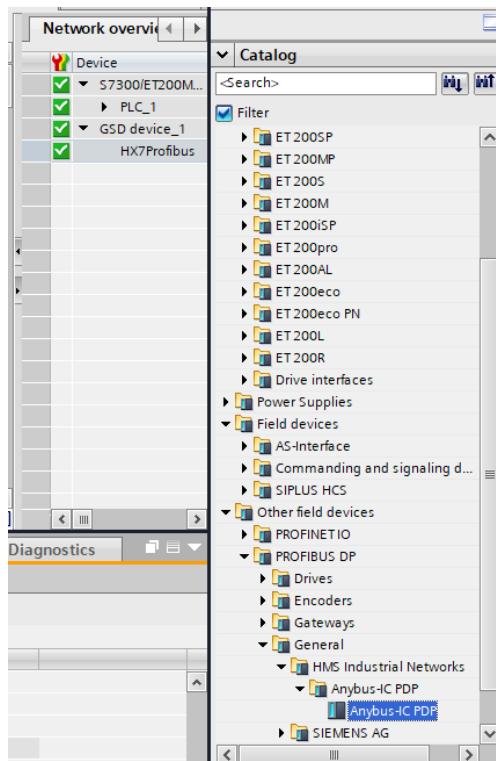

### 3.1. Import GSD

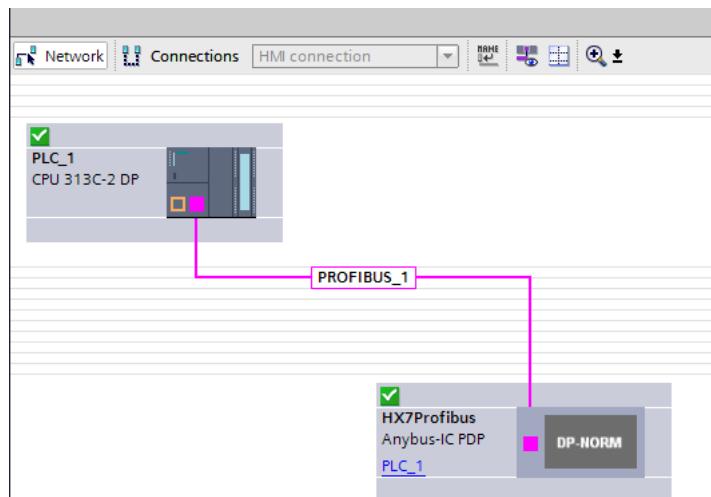

Using a delivered configuration file (GSD), add a new device into the environment. Open OPTIONS tab, next click MANAGE GENERAL STATION DESCRIPTION FILES (GSD) entry and select access path to the GSD file.

With the file successfully added, the Anybus-IC-PDP module is displayed on the list of the devices.

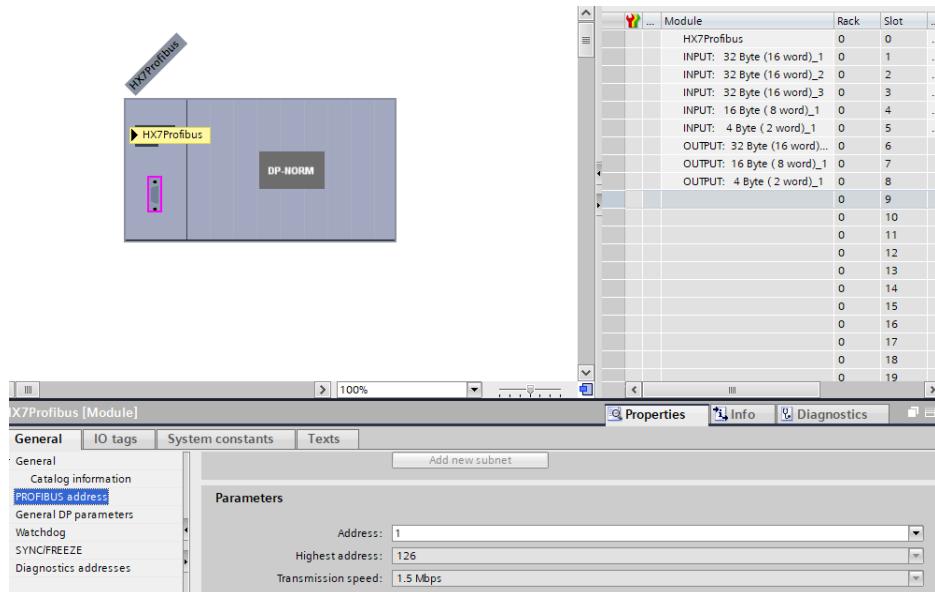

Now it is necessary to make a network comprising a MASTER controller and a newly added SLAVE module.

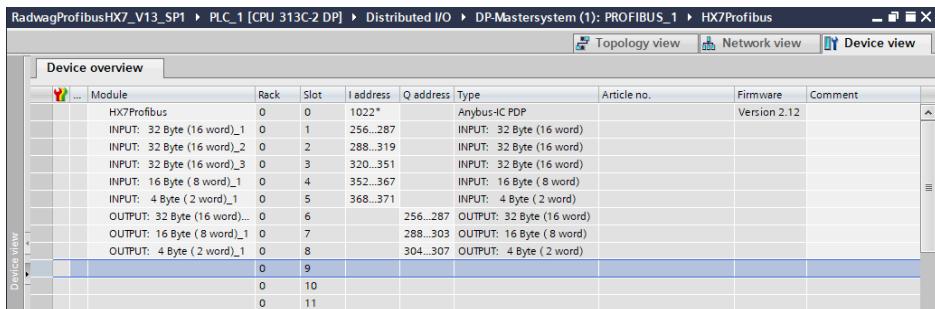

### 3.2. Module Configuration

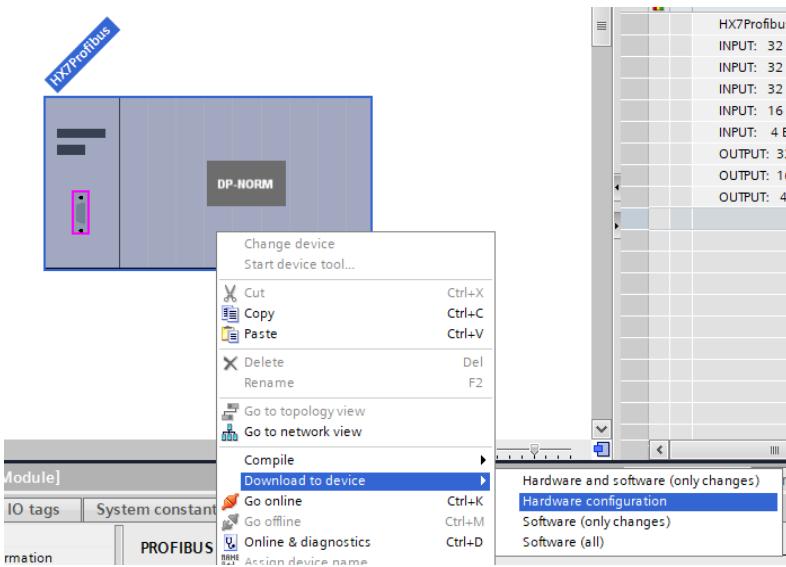

Now, specify the module address. Make sure that the address is accordant with the address set in the scale menu.

Next configure the module. First specify input and output registers size, define their start addresses. From the list of available INPUT and OUTPUT modules select such modules as presented in the picture below. Maximum size of input data is 116 bytes, maximum size of output data is 116 bytes too. In the project, default start addresses have been used – 256 for the INPUT module and 256 for the OUTPUT module:

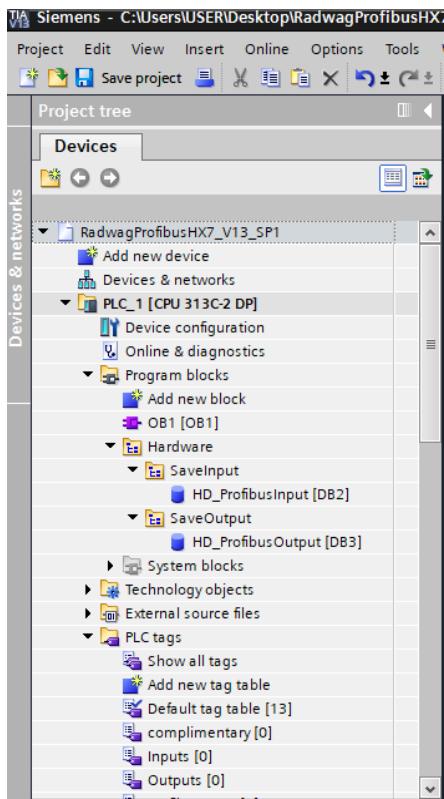

At this stage it is possible to upload the hardware configuration into the controller, and to start data upload.

Upon successful compilation and code reading, the MASTER and SLAVE shall establish communication. Now proceed to the process of program code making.

#### 4. DIAGNOSTICS APP

Start creating the app by defining names of symbolic input and output registers. Input and output registers of PROFIBUS module have been specified in data blocks, HD\_ProfibusInput and HD\_ProfibusOutput, in HARDWARE group in PROGRAM BLOCKS.

HD\_ProfinetOutput and HD\_ProfinetInput blocks represent input/output registers of the scale's PROFIBUS module. See the screenshots below:

...wagProfbusHX7\_V13\_SP1 > PLC\_1 [CPU 313C-2 DP] > Program blocks > Hardware > SaveOutput > HD\_ProfinetOutput [DB3]

|    | Name                    | Data type | Offset | Start value | Monitor value | Retain                              | Visible in ...                      | Setpoint                            |
|----|-------------------------|-----------|--------|-------------|---------------|-------------------------------------|-------------------------------------|-------------------------------------|
| 1  | Static                  |           |        |             |               |                                     |                                     |                                     |
| 2  | command                 | Word      | 0.0    | 16#00       | 16#0000       | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |                                     |

Now, in the main program loop, make function assigning states of physical scale registers to registers in HD\_ProfibusInput and HD\_ProfibusOutput data blocks. Functions may look as presented below. In the example, mass readout method and record of "output state" and "min" registers are presented.

| OB1 |        |           |        |               |         |
|-----|--------|-----------|--------|---------------|---------|
|     | Name   | Data type | Offset | Default value | Comment |

Upon compilation and upload of the program to the controller in data block, it is possible to read input registers (MONITOR ALL) and to record output registers (e.g. by change of START VALUE and LOAD START VALUES AS ACTUAL) of the SLAVE module.
